

# Short contents

|                                                                          |            |
|--------------------------------------------------------------------------|------------|
| Preface                                                                  | xv         |
| 1 Basic thermodynamic and biochemical concepts                           | 1          |
| <b>Part 1: Thermodynamics and kinetics</b>                               | <b>21</b>  |
| 2 First law of thermodynamics                                            | 23         |
| 3 Second law of thermodynamics                                           | 46         |
| 4 Phase diagrams, mixtures, and chemical potential                       | 71         |
| 5 Equilibria and reactions involving protons                             | 94         |
| 6 Oxidation/reduction reactions and bioenergetics                        | 114        |
| 7 Kinetics and enzymes                                                   | 134        |
| 8 The Boltzmann distribution and statistical thermodynamics              | 163        |
| <b>Part 2: Quantum mechanics and spectroscopy</b>                        | <b>173</b> |
| 9 Quantum theory: introduction and principles                            | 175        |
| 10 Particle in a box and tunneling                                       | 198        |
| 11 Vibrational motion and infrared spectroscopy                          | 221        |
| 12 Atomic structure: hydrogen atom and multi-electron atoms              | 238        |
| 13 Chemical bonds and protein interactions                               | 270        |
| 14 Electronic transitions and optical spectroscopy                       | 291        |
| 15 X-ray diffraction and extended X-ray absorption fine structure        | 317        |
| 16 Magnetic resonance                                                    | 344        |
| <b>Part 3: Understanding biological systems using physical chemistry</b> | <b>373</b> |
| 17 Signal transduction                                                   | 375        |
| 18 Membrane potentials, transporters, and channels                       | 390        |
| 19 Molecular imaging                                                     | 405        |
| 20 Photosynthesis                                                        | 421        |
| Answers to problems                                                      | 439        |
| Index                                                                    | 488        |
| Fundamental constants                                                    | 493        |
| Conversion factors for energy units                                      | 493        |
| The periodic table                                                       | 494        |
